UNIVERSITY OF COPENHAGEN

# Funktioner

Organisering = nemmere at forstå og vedligeholde

Leksikografisk virkefelt

```
let greetings (name : string) : string =
```

```
  "Hello " + name
```

Indryk angiver funktionskroppen

```
let str = greetings "Jon"
```

```
printfn "%A" str
```

```
printfn "%A" (greetings "World")
```

```
> let greetings (name : string) : string  
=
```

```
- "Hello " + name;;
```

```
val greetings : name:string -> string
```

```
let greetings name =
```

```
  "Hello " + name
```

```
let greetings name = "Hello " + name
```

```
let greetings name : string = "Hello " + name
```

```
let greetings (name : string) = "Hello " + name
```

# Dokumentation - simpel

3 = 2 + 1 linjekommentar

```
/// Write a simple greeting to someone
```

```
let greetings (name : string) : string = "Hello " + name // name is without space in front
```

```
(* This function needs to be tested! *)
```

Almindelig kommentarer udenfor dokumentationsstandarden

# Løs en andengradsligning (i 8 trin)

1. Note omhvad skal funktionen gøre  
/// Given parameters a, b, and c, solve for x  
/// when  $a*x*x + b*x + c = 0$
2. Find på et navn  
solve
3. Skriv et eksempel på dens brug  
let a = 1.0  
let b = 0.1  
let c = -1.0  
let x = solve a b c  
printfn "0 = %Ax^2 + %Ax + %A => x = %A" a b c x
4. Beslut typen  
let solve (a: float) (b: float) (c: float) : float\*float = (-3.4, 2.1)
5. Lav en implementation Mockup funktion   
let solve (a: float) (b: float) (c: float) : float\*float =  
  let sqrted = sqrt (b \*\* 2.0 - 4.0 \* a \* c)  
  ((-b - sqrted) / (2.0 \* a), (-b + sqrted) / (2.0 \* a))

$$ax^2 + bx + c = 0$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Lav en funktion i 8-trin

1. Note omhvad skal funktionen gøre
2. Find på et navn
3. Skriv et eksempel på dens brug
4. Beslut typen
5. Lav en implementation
6. (Intern test)
7. Kør eksemplet fra 3 (og 6)
8. Skriv dokumentation

# Løs en andengradsligning (i 8 trin)

```
/// Given parameters a, b, and c, solve for x
```

```
/// when  $a*x*x + b*x + c = 0$ 
```

```
let solve (a: float) (b: float) (c: float) : float*float =
```

```
    let sqrt d = sqrt (b ** 2.0 - 4.0 * a * c) // We assume that  $d \geq 0$ 
```

```
    ((-b - sqrt d) / (2.0 * a), (-b + sqrt d) / (2.0 * a))
```

```
// Example use of solve
```

```
let a = 1.0
```

```
let b = 0.1
```

```
let c = -1.0
```

```
let x = solve a b c
```

```
printfn "%Ax^2+%Ax+%A=0 => x=%A" a b c x
```

# Dokumentationsstandarden

```
/// <summary>
```

```
/// Given parameters a, b, and c, solve for x
```

```
/// when  $a \cdot x^2 + b \cdot x + c = 0$ 
```

```
/// </summary>
```

```
/// <param name="a">Quadratic coefficient.</param>
```

```

```

```
let x = solve a b c
```

```
printfn "%Ax^2+%Ax+%A=0 => x=%A" a b c x
```

# Virkefelt (scope) vs. miljø (environment)

En værdi/variable/funktions **virkefelt/scope** er den del af et program, hvor den er synlig

Et **miljø/environment** er en samling af værdier/variable/funktioner tilgængeligt på et givent sted i et program

```
% dotnet fsi printDoubles.fsx
2 4 6
```

# Håndkøring (tracing)

## simple.fsx

```
1 let a = 3  
2 printfn "%A" a
```

Trin	Linje	Miljø	Bindings osv.
0	-	E0	-
1	1	E0	a=3
2	2	E0	output = "3"

Initiale oprettelse  
kan udelades

# Håndkøring (tracing)

## function.fsx

```

1 let double n =
2   2*n
3
4 let result = double 5
5 printfn "%A" result

```

Trin	Linje	Miljø	Bindings osv.
1	1	E0	double = ((n), 2*n, ())
2	4	E0	result = double 5?
3	1	E1	((n=5), 2*n, ())
4	2	E1	return = 10
5	4	E0	result = 10
6	5	E0	output = "10"

Opret nyt miljø, kopier og indsæt argumentværdi

Luk indlejret miljø, vend tilbage til kaldemiljø, og erstat ukendt værdi.

Funktioner er værdier (closures):

fkt = ((argument navne), udtryk, miljøtilstand)

# Håndkøring (tracing)

## loop.fsx

```

1 let printDoubles n =
2   let mutable i = 1
3   while i <= n do
4     printf "%A " (2*i)
5     i <- i + 1
6   printfn ""
7
8 let n = 2
9 printDoubles n

```

Trin	Linje	Miljø	Bindings osv.
1	1	E0	printDoubles = ((n), body, ())
2	8	E0	n = 2
3	9	E0	result = printDoubles 2?
4	1	E1	((n=2), body, ())
5	2	E1	i = $\alpha_1$ , i <- 1
6	3	E2	((), while-body, (n=2, i= $\alpha_1$ ))
7	3	E2	exit = false
8	4	E3	((), 2*i, (n=2, i= $\alpha_1$ ))
9	4	E3	result = 2
10	4	E2	output = "2"
11	5	E2	i <- 2
12	3	E2'	((), while-body, (n=2, i= $\alpha_1$ ))
13	3	E2'	exit = false
14	4	E3	((), 2*i, (n=2, i= $\alpha_1$ ))
15	4	E3	result = 4
16	4	E2'	output = "4"
17	5	E2'	i <- 3
18	3	E2''	((), while-body, (n=2, i= $\alpha_1$ ))
19	3	E2''	exit = true
20	6	E1	output = <newline>
21	9	E0	result = ()

## Bunken (heap)

Trin	Bindings osv.
5	$\alpha_1 = 1$
11	$\alpha_1 = 2$
17	$\alpha_1 = 2$

Luk while-miljø og  
opret et nyt

# Resumé

I denne video hørte du om:

- Håndkøring (tracing) af
  - et simpelt program
  - en funktion
  - en while-løkke med mutérbar værdi
