0.1 Web

0.1.1 Teacher's guide

Emne Input/output from the web

Sværhedsgrad medium

0.1.2 Introduction

The internet is a great source of information, and many files are published as html-files. In the following assignment(s), you are to work with html-files on the internet.

Note that most internet pages requires a valid certificate before they will allow your program to access it. By default, Mono has no certificates installed. One way to install useful certificates is to use mozroots, which is a part of the Mono package. On Linux/MacOS you do the following from the console:

```
mozroots --import --sync
```

On Windows you type the following (on one line)

```
mono "C:\Program Files (x86)\Mono\lib\mono\4.5\mozroots.exe" --import
--sync
```

Note that your installation of mozroots may be in a different path, and you may have to adapt the above path to your installation. After running the above, your program should be able to read most pages without being rejected.

0.1.3 Exercise(s)

0.1.3.1: Make a program with the function,

```
printWebPage : url:string -> string option
```

which reads the content of the internetpage url and returns its content as a string option.

0.1.3.2: In the html-standard, links are given by the <a> tags. For example, a link to Google's homepage is written as Press to go to Google.

Make a program countLinks which includes the function

```
countLinks : url:string -> int
```

The function should read the page given in url and count how many links that page has to other pages. You should count by counting the number of <a substrings. The program should take a url, pass it to the function and print the resulting count on the screen. In case of an error, then the program should handle it appropriately.
